

IN THE SPECIFICATION

The Examiner reminded the Applicants of the proper language and format for an Abstract of disclosure. Applicants refer the Examiner to the preliminary amendment filed 9/28/2006 wherein the original Abstract was replaced. For ease of reference, Applicants include below a copy of the abstract filed on 9/28/2006.

Abstract

A device includes a housing encapsulating a rotating member, at least one arrangement for generating a magnetic field due to electrical current and a displaceable shaft at least partly having exterior grooves. The rotating member has a portion with inner grooves corresponding to grooves on the shaft. At least one magnetic element can be arranged on an outer surface of the rotating member substantially perpendicular to an extension direction of the grooves for interaction with the device and rotating said rotating member.
